

Release 1.11.0

Features:

- **WICORE-1063 - Malware Reports: Combine "Server Name", "Scan Type", and "Status" Fields into One Row**

- UI improvement in the Malware Reports module: the fields "Server Name", "Scan Type", and "Status" are now displayed inline in a single row for a more compact and user-friendly layout.

- **WICORE-1062 - Malware Reports: Expand Text Area Field**

- The text area field in Malware Reports has been increased in height to allow users to view the full content without the need for scrolling or resizing the field.

Bugfixes:

- **WICORE-1061 - Incident Reports: View Drawer Field Issues & Enable Edit After Completion**

- Fixed layout and rendering issues in the view drawer of the Incident Reports module. Additionally, users can now edit completed reports by clicking the edit icon, allowing post-submission corrections when necessary.

- **WICORE-1060 - Remove "Lesson Learned" Column from Incident Reports Table**

- The "Lesson Learned" column has been removed from the main table view in the Incident Reports module to reduce clutter and focus on more relevant information.

- **WICORE-1059 - Check Column Overflow for Names and Titles**

- Standardized column widths across all reports to prevent overflow issues. Fields containing names and titles will now wrap or truncate gracefully to maintain clean layouts.

• **WICORE-1056 - Fix Sorting Logic in Severity Column**

- Corrected the sorting behavior of the "Severity" column across reports, which previously did not sort values as expected (e.g., by severity level order).

• **WICORE-1055 - SLI Field Marked as Required**

- The SLI (Service Level Indicator) field is now visibly marked as required in all applicable forms, ensuring users don't skip this critical field during data entry.

• **WICORE-1054 - Add Translations for VCSSv3 in Violation Reports Module**

- Introduced translations for all VCSSv3-related elements in the create, edit, and view drawers of the Violation Reports module to improve localization support.

• **WICORE-975 - Violation Reports: Summary Not Required for Status Change**

- Improved UX logic so that when users update only the status of a violation report during editing, the "Summary" field is no longer required unless changes to the report content are made.

• **WICORE-895 - SLA in Violation Reports**

- Introduced proper handling and visual display for SLA (Service Level Agreement) in Violation Reports. SLA deadlines are now more clearly shown and managed.
