

Release 1.11.0

Features:

• **WICORE-1023 - AI Assistant: Markup**

- Implemented the frontend for the new AI Assistant — an AI-based helper that will be integrated into various system modules. The markup includes:
 - an input field for user queries,
 - a response window to display answers from the assistant,
 - and basic controls (send, clear, loading indicator).
- The interface is designed to be easily connected to backend logic and OpenAI API integration in the next stages.

• **WICORE-909 - AI Assistant: MVP Logic**

- Developed the Minimum Viable Product (MVP) logic for the AI Assistant. It includes:
 - ability to accept text-based user queries,
 - send those queries to the OpenAI integration (via the Integrations module),
 - return and display the assistant's response in the UI.
- Basic request validation and error handling were also added (e.g., when the service is unavailable or token limits are exceeded).
- The MVP version is ready for future feature expansion.

• **WICORE-796 - Frontend Part**

- Implemented the frontend UI and integration layer for managing external services, including telephony support and configuration tools.

• **WICORE-559 - Telephony Integrations. Commpeak**

- Integrated the Commpeak telephony service into the system. Enabled communication with clients directly from the platform using Commpeak's API for voice calls and event handling.
