

Release 1.11.0

Features:

• WICORE-1078 - Add `subID` Field to Client Form (Frontend)

- A new `subID` field has been added to the client's form on the frontend.

• WICORE-1069 - Replace Snippets Code Editor with Monaco Editor

- The code editor used in the Snippets module was replaced with the more advanced Monaco Editor, improving the editing experience.

• WICORE-1041 - Add Tooltip Info to Cards in Bucket Configurations and Automation Pages

- Tooltips were added to all cards in the Bucket Configuration and Automation pages to help users better understand their purpose.

• WICORE-976 - Add Subtype Filter to Action Filters

- A filter by subtype was added to the filters in the Actions module for more granular control.

• WICORE-1072 - Introduce Dynamic Fields

- Implemented logic that allows sending dynamic data to a WebHook after a lead is registered in a bucket. Now, fields such as **email**, **status**, **subID**, **affiliateID**, and **sourceID** can be passed directly via parameters in the WebHook URL.

• WICORE-1071 - New Buckets API endpoint for retrieving lead statuses

- A new API endpoint `/buckets/{bucketId}/{affiliateID}/leads/{sourceId}` has been introduced. This endpoint allows fetching lead statuses filtered by bucket ID, affiliate ID, and source ID. The request body accepts a list of email addresses, and the response returns a mapping of each email to its current status (e.g., active, inactive). This functionality helps to validate leads and their statuses within specific buckets and affiliates, improving lead management and filtering by source.

• **WICORE-1034 - Implement Custom Table for API-Only Usage**

- **Developed a custom table accessible exclusively through API endpoints to allow dynamic storage and management of flexible data entities. The implementation includes:**
 - **Create:** Ability to create new custom records with various field types such as strings, numbers, and nested JSON objects.
 - **Read:** Retrieve paginated lists of custom records, with support for filtering by field values and sorting by specified criteria.
 - **Update:** Modify existing custom records by their unique identifier, updating any of the stored fields.
 - **Delete:** Remove custom records based on their ID.
 - **Search:** Fetch a single custom record by specifying any field name and its corresponding value.
- This API-centric approach provides flexibility for clients to store and manage arbitrary structured data under customizable entity names (e.g., "customer"), without modifying the core database schema. It is designed to support extensibility and integration needs where dynamic data handling is required.

• **WICORE-903 - Add Telephony Widget to Clients' Actions**

- A new telephony widget was added to the client's actions module, enabling direct interaction with clients via phone through integrated telephony providers.

• **WICORE-1080 - Add Active Links for "Edit" and "Create" Actions in Logs**

- Implemented clickable links in the logs module for action entries of type "edit" and "create". Clicking these links redirects users directly to the related entities.

Bugfixes:

• **WICORE-1050 - Status Display Issue in Configurations**

- Fixed a problem where statuses were not displaying correctly in the configurations module.

• **WICORE-1049 - Add Translations for Bank Info Drawer**

- Translations were added for all labels and content shown in the bank info drawer.

• **WICORE-1044 - Action Confirmation Popup Disappears Instantly When Deleting TFA Method**

- Fixed a bug where the confirmation popup for deleting a Two-Factor Authentication method would immediately disappear after appearing.

• **WICORE-1043 - Bucket Module Issues**

- Various bugs and inconsistencies in the Buckets module were resolved.

• **WICORE-1042 - Change Manager & Affiliate Fields to Searchable Selects**

- The input type for selecting an affiliate or manager was changed to a searchable select for better usability in large datasets.

• **WICORE-1045 - Action Change History Not Displayed**

- Fixed an issue where the history of changes made to actions was not properly displayed in the UI. Now all edits and updates are visible in the drawer.

• **WICORE-1081 - Add Search by `_id` in Requests Search (Check Other Modules Too)**

- Extended search functionality in the Requests module by adding support for searching via `_id`. Similar enhancements were applied across other modules to ensure consistency.

Revision #3
